

M122

Automate processes with a scripting language

27.05.2026 – C. Lindauer

Today

Lesson	Content	Competence
1	Administration, Overview	
1	Input about Docstring Conventions	
1	Project status	
1-3	Work on your own	

What is a Docstring?

- A docstring is a string literal that occurs as the first statement in a module, function, class, or method definition. Such a docstring becomes the `__doc__` special attribute of that object.
- This information can be accessed, when calling a module, function, class or method

One-line Docstrings

- Write the information between triple quotes `"""` at the start of the function.

```
def main():  
    """Main function that orchestrates the Pokemon report generation workflow."""  
    print("=" * 50)  
    print("        POKEMON REPORT GENERATOR (OOP)")  
    print("=" * 50)
```

Multi-line Docstrings

- Multi-line docstrings consist of a summary line just like a one-line docstring, followed by a blank line, followed by a description.

```
def generate_report(pokemon):  
    """  
    Generates a formatted text report for a Pokemon.  
  
    Args:  
    |   pokemon (Pokemon): A Pokemon object with the information to report  
  
    Returns:  
    |   str: Formatted report string  
    """  
    total_stats = pokemon.get_total_stats()  
  
    return f"""
```

Project Self-Check & Status Update

Reflect on the current state of your Module 122 project and prepare a short status update.

Task:

Take **10 minutes** to review your project plan and compare your current progress with your planned timeline. Then prepare a brief status update and **discuss with your teacher** that answers the following points:

Timeline Check

- Are you currently on schedule, ahead, or behind your project plan?

Completed Work

- Which tasks or phases have you already finished?

Next Steps

- What tasks are you working on right now, and what are the next upcoming tasks?

Documentation Progress

- What is the status of your documentation (UML diagrams etc.)?
